1 Einleitung

Hier steht die Einleitung zu dieser Ausarbeitung. Sie soll nur als Beispiel dienen. Nun viel Erfolg bei der Arbeit!

Die Arbeit ist in folgender Weise gegliedert: Zuerst werden Grundlagen und verwandte Arbeiten vorgestellt (Abschnitt 2). It is followed by a presentation of hints on $\text{\LaTeX}$ (Abschnitt 3). Schließlich fasst Abschnitt 4 die Ergebnisse der Arbeit zusammen und stellt Anknüpfungspunkte vor.

2 Verwandte Arbeiten

Eine Beschreibung relevanter wissenschaftlicher Arbeiten mit Bezug zur eigenen Arbeit. Der Abschnitt kann je nach Kontext auch an anderer Stelle stehen.

Winery [2] is a graphical modeling tool. The whole idea of TOSCA is explained by Binz et al. [1].

3 $\text{\LaTeX}$ Hinweise

Hier sollen allgemeine $\text{\LaTeX}$ -Hinweise gegeben werden, damit man Minimalbeispiele vorliegen hat, um sofort loszulegen.

3.1 Trennung von Absätzen

Pro Satz eine neue Zeile. Das ist wichtig, um sauber versionieren zu können. In LaTeX werden Absätze durch eine Leerzeile getrennt. Analogie zu Word: Bei Word werden neue Absätze durch einmal Eingabetaste herbeigeführt. Dies führt bei LaTeX jedoch nicht zu einem neuen Absatz, da LaTeX direkt aufeinanderfolgende Zeilen zu einer Zeile zusammenfügt. Mächte man nun einen Absatz haben, muss man zweimal die Eingabetaste drücken. Dies führt zu einer leeren Zeile. In Word gibt es die Funktion Großschreibetaste und Eingabetaste gleichzeitig. Wenn man dies drückt, wird einer harter Umbruch erzwungen. Der Text fängt am Anfang der neuen Zeile an. In LaTeX erreicht man dies durch Doppelbackslashes (`\`) erzeugt.

Dies verwendet man quasi nie.

Folglich werden neue Abstätze insbesondere *nicht* durch Doppelbackslashes erzeugt. Beispielsweise begann der letzte Satz in einem neuen Absatz. Eine ausführliche Motivation hierfür findet sich in <http://loopspace.mathforge.org/HowDidIDoThat/TeX/VCS/#section.3>.

3.2 Notes separated from the text

The package `mindflow` enables writing down notes and annotations in a way so that they are separated from the main text.

3.4 Hyphenation

L^AT_EX automatically hyphenates words. When using microtype, there should be fewer hyphenations than in other settings. You might still need to tweak the hyphenation. Here are some hints:

In case you write „application-specific“, then the word will only be hyphenated at the dash. You can also write `applica\allowbreak{tion-specific}` (result: application-specific), but this is much more effort.

You can now write words containing hyphens which are hyphenated at other places in the word. For instance, `application"=specific` gets application-specific. This is enabled by an additional configuration of the babel package.

3.5 Typesetting Units

Numbers can be written plain text (such as 100), by using the siunitx package as follows: $100 \frac{\text{km}}{\text{h}}$, or by using plain L^AT_EX (and math mode): $100 \frac{\text{km}}{\text{h}}$.

3.8 Theorem-like Environments and Mathematics

The `llncs` class already provides the theorem-like environments `theorem`, `proposition`, `lemma`, `corollary`, `definition`, `example`, `exercise`, `note`, `problem`, `question`, `remark`, and `solution` as well as the unnumbered `proof` environment – no additional package is required.

Definition 1 (Idempotence). *An operation f is idempotent if $f(f(x)) = f(x)$ holds for all inputs x .*

Proposition 1. *The identity operation is idempotent.*

Lemma 1. *An idempotent operation fixes every element of its image.*

Theorem 1. *If two idempotent operations f and g commute, their composition $f \circ g$ is idempotent.*

Beweis. Since f and g commute and are idempotent,

$$(f \circ g)((f \circ g)(x)) = f(f(g(g(x)))) = f(g(x)) = (f \circ g)(x). \quad (1)$$

□

Korollar 1. *Applying $f \circ g$ a second time yields no further change, as Gleichung (1) shows.*

3.12 Plots with pgfplots

The pgfplots package plots functions directly in L^AT_EX, similar to MATLAB or gnuplot. Some visual examples are available in the package documentation¹.

Coordinates can also be given explicitly instead of as a function:

1079 Brackets work as designed:
1080 <test>
1081 One can also input backticks in verbatim text: \verb|`test`|.
```

Acronyms can be typeset in running text with `\initialism`, which sets them as small caps that blend into the surrounding lowercase text. It is the lightweight alternative to the full acronym and glossary management (`\gls`, with an automatic list of abbreviations) provided by the thesis variants: `\initialism`

only typesets the acronym and does not add it to any list. The macro and a few ready-made acronyms (`\OMG`, `\BPEL`, `\BPMN`, `\UML`) are defined in `commands.tex`, where you can add your own.

The UML is maintained by the OMG; related standards include BPEL and BPMN. Any acronym can be set inline with REST or HTTP.
